

LOFAR

D. McKay-Bukowski

Rutherford Appleton Laboratory, STFC, Didcot, UK

LOFAR (Low Frequency Array) is a new pan-European radio telescope, developed and administered by the Netherlands Foundation for Research in Astronomy. This presentation, in addition to giving a status update, provides a compact overview of the technical project, explains the scientific rationale and describes the international collaboration which makes it all possible. In particular, it will cover the relevance of this new endeavour to atmospheric and space research in the Arctic.
